In Pursuit of a Self Sustaining Life

My goal as a web developer has been to develop a self sustaining, self sufficient life. To achieve this, I have spent the year designing a mobile web developers' studio. This studio would allow me to travel from city to city, region to region — taking internet connectivity with me even in the most remote of locations within the United States. This is advantageous in multiple ways:

1. Map out and attend major industry events at a lower cost. This also helps evangelize our tech and promote us nationally in a positive light.
2. Isolate myself from daily noise during code sprints. This allows me to focus on the code I'm developing and eliminate mental blocks.
3. Routinely check into HQ. I can schedule regular check ins at the office on the occasion it might be necessary.

Ultimately I seek autonomy; in how I work and in life. I'm always trying to expand my skills as a developer and learn more. I've started non-profit and open source projects as well as contributed to more. I have the work to life ratio balanced, however I need the keystone, a position that allows remote work.

You'll find an eclectic array of talents within my resume, from developing software to marketing to education. My experience ranges from starting non-profit websites, building applications for higher education and the public sector, and leading the marketing team in their web strategy at a multi-million dollar national company.

I look forward to your correspondence,

— Nicholas D. Kline
